```
#include <stdio.h>

double eleva(double x, int y){
    int aux=1;
    int i;
    while(i){
        if(y>1){
            x=x;
            for(i=1; i<=y; i++){
                aux*=x;
            }
            printf("%d", aux);
            break;
        }
        else if(y==0){
            x=1;
            printf("%d", x);
            break;
        }
        else if(y<0){
            x=x;
            y=y*-1;
            for(i=1; i<=y; i++){
                aux*=x;
            }
            aux=1/aux; printf("%d", aux); break; } } }
```

expiraf

```
int main() {  
    declare x;  
    int y;  
  
    scanf("%d", &x);  
    scanf("%d", &y);  
  
    elena(x, y);  
  
    return 0;  
}
```
